

JBSP Mandal's Art & Science College, Department Of Chemistry Topic : Acids and Alkalis Prof. Ajit Kale

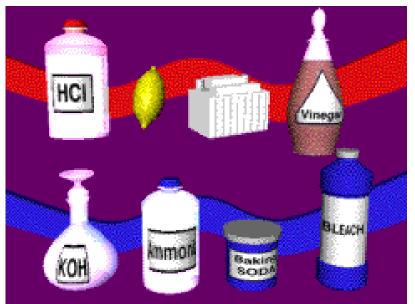

Acids and Alkalis

Learning Objectives

- To know that solutions can be sorted by whether they are: acid, alkali or neutral.
- To understand that an alkali reacts with an acid to cancel it out.

 To know that indicators show you how acidic or alkaline a solution is.

Acids and alkalis When a substance dissolves in water it makes a <u>solution</u>.

Solutions can be sorted by whether they are: acid, alkali or neutral.

When the **oxide** of some **non-metals** dissolve in **water** they make an **acid.** Non-Metal + Oxygen Oxide +Water +Water Acid

Acids have a **sour taste**. They are **corrosive**.

Acids react with metals and carbonates.

- Metal + Acid Salt + Hydrogen
- magnesium + _____ magnesium chloride + hydrochloric acid hydrogen

Acid + Carbonate — Salt + Water + Carbon dioxide sulphuric acid + — copper sulphate + water + copper carbonate carbon dioxide

There are many acids present in our everyday lives.

Lemon juice contains citric acid, and vinegar contains ethanoic acid.
Some strong acids are hydrochloric acid, sulphuric acid and nitric acid.
Some weak acids are ethanoic acid, citric acid and carbonic acid.

Neutralisation

 Acids and alkalis react with each other. The alkali cancels out the acid in the reaction. This is called neutralisation.

Salts

- The salt made depends on the <u>acid and</u> <u>alkali used</u>.
- The salt contains the metal atom from the alkali, and part of the acid molecule.

The salts of sulphuric acid are known as **sulphates.** The salts of hydrochloric acid are known as **chlorides.**

The salts of nitric acid are known as **nitrates.**

Metal ↓ + Oxygen Oxide +Water ↓ Alkali

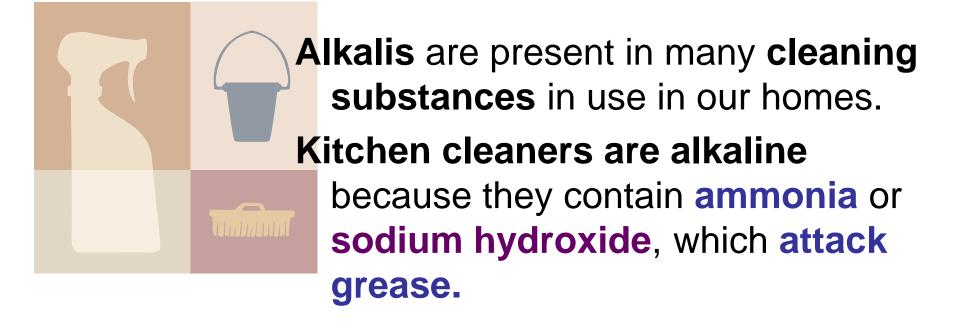

Alkalis

Many everyday substances are alkalis. They feel **soapy**. They are **corrosive**.

When the **oxides of some metals** dissolve in **water** they make an **alkali solution**.

Alkalis react with acids and neutralise them.

Calcium hydroxide and sodium hydroxide are strong alkalis.

The most recognisable and common weak alkali is ammonia.

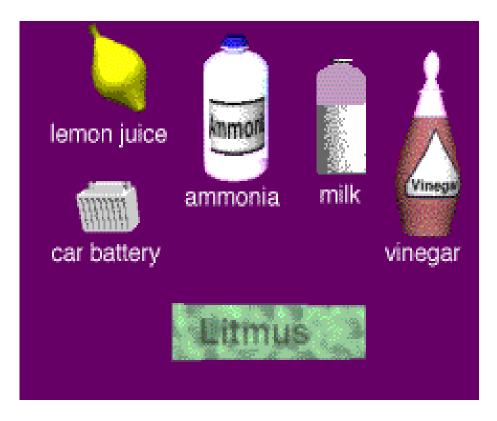

Indicators

Indicators help you find out whether a solution is acidic or not.

They change colour in acid or alkaline solutions.

Different indicators change to different colours.

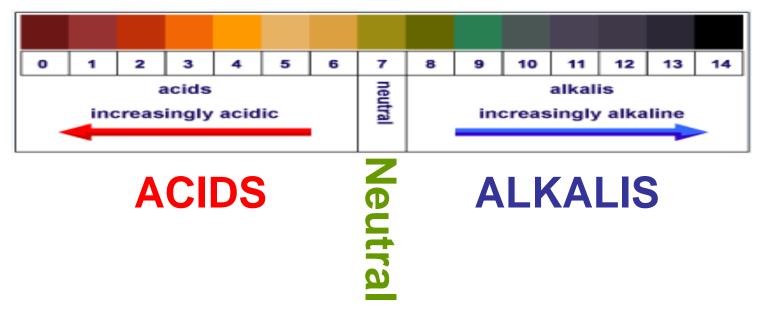

- Litmus is an indicator. It changes colour in acid and alkaline solutions.
- Litmus is red in an acid.
- Litmus is **blue** in an **alkali**.

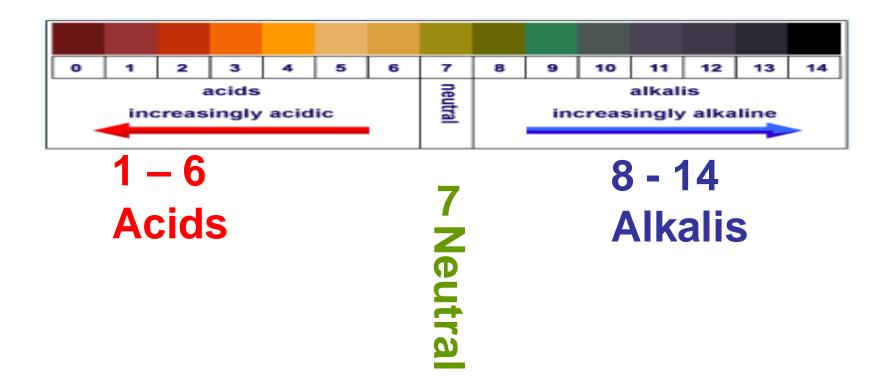

Universal Indicator

Universal indicator changes colour in acids and alkalis.

Its colour shows the strength of an acid or alkali.

The pH scale

Applications of Neutralisation

Insect Stings Bee stings are acidic and can be neutralised with baking soda (bicarbonate of soda).

Wasp stings are alkaline and can be neutralised with vinegar.

 Indigestion: Our stomach carries around hydrochloric acid.

Too much of this leads to indigestion.

To cure indigestion, you can neutralise the excess acid with baking soda or specialised indigestion tablets.

Soil Treatment: When soils are too acidic (often as a result of acid rain) they can be treated with slaked lime, chalk or quicklime, all alkalis. Plants and crops grow best in neutral soils. Factory Waste: Liquid waste from factories is often acidic. If it reaches a river it will destroy and kill sea life of many forms. Neutralising the waste with slaked lime can prevent this.

More Applications of Neutralisation
